

PLUGINS		skills / hooks / subagents
r-project-core	every R research project	9 / 14 / 0
r-package-dev	R package development	3 / 3 / 0
r-targets	{targets} pipelines	6 / 0 / 1
r-geospatial	GIS and spatial analysis	3 / 0 / 0
r-spades	SpaDES modules	2 / 0 / 0
r-landis-ii	LANDIS-II integration	2 / 0 / 0
r-reporting	reports and provenance	3 / 0 / 0
r-code-review	software review	1 / 0 / 3

BUNDLES: RESEARCH, PLUS ONE PER FRAMEWORK		4
r-bundle-research	an R research project	
	project-core, geospatial, reporting, code-review, package-dev	
r-bundle-landis	research, plus LANDIS-II	
	research, landis-ii	
r-bundle-spades	research, plus SpaDES	
	research, spades	
r-bundle-targets	research, plus targets	
	research, targets	

OR ENABLE PLUGINS DIRECTLY	
R package	core, package-dev, code-review
{targets} pipeline	core, targets, code-review
Spatial / GIS	core, geospatial
produces reports	add reporting

INSTALL: ADD BOTH MARKETPLACES

1. add the marketplaces

/plugin marketplace add FOR-CAST/ai_workflows
/plugin marketplace add posit-dev/skills

Nothing auto-adds another marketplace. r-package-dev depends on r-lib@posit-dev-skills: add both first, in either order, or it and every bundle above it report the dependency missing.

2. enable a bundle, then set policy

/plugin install r-bundle-research@ai-workflows
/r-project-core:project-policy

3. share the setup with the project

.claude/settings.json carries extraKnownMarketplaces and enabledPlugins declare the posit marketplace there too, so the dependency resolves. The claude plugin CLI does not read project settings: install from a session, once the folder is trusted.

UNINSTALL, OR JUST TURN IT OFF

stop it, remove it, or forget the source

/plugin disable r-package-dev@ai-workflows
/plugin uninstall r-bundle-research@ai-workflows
/plugin prune
/plugin marketplace remove ai-workflows

disable keeps a plugin installed but inert. uninstall removes it, and prune then drops the dependencies it pulled in that nothing else needs, which is worth running after removing a bundle.

or switch off one piece

One hook: drop its entry from that plugin's hooks/hooks.json. All of them: disableAllHooks in settings.
One policy rule: remove its key from r-project-policy.json.

THREE KINDS OF TOOLING	
skills	advice, loaded only when it matches
hooks	rules, run on every turn, failing open
subagents	read-only reviewers, on request

SKILLS: WHEN TO REACH FOR THEM		29
r-project-core		
citation-integrity•	any DOI or reference	9
/commit	write the commit	
design-log	work spanning sessions	
hpc-cluster-runs•	launch or stop a long run	
project-config-layout•	a setting missed a worker	
/project-policy	a guard fires wrongly	
project-tests-ci•	tests and CI, no package	
r-style•	writing or editing any R	
root-cause-fixes	before any fix	
r-targets		
targets-cluster-runs•	tar_make on shared nodes	6
targets-debugging	a target failed or hung	
targets-project-setup•	structuring _targets.R	
targets-spatial•	terra objects as targets	
targets-staleness•	up to date, but is not	
targets-testing-ci•	validator, targets CI	
r-geospatial		
raster-scale-and-memory•	raster too big for RAM	3
spatial-io-and-crs•	pointers do not serialise	
vector-geometry-hygiene•	empty polygons, slivers	
r-package-dev		
package-change-workflow•	a package you maintain	3
package-conventions•	before air or document()	
package-dependencies•	no visible global function	
r-reporting		
provenance-receipts•	where data came from	3
quarto-reports•	a render landed oddly	
report-writing•	prose someone else reads	
r-spades		
module-contract•	wiring a SpaDES module	2
spades-caching	re-runs it should not	
r-landis-ii		
landis-inputs•	before a LANDIS run	2
landis-outputs•	reading a LANDIS map	
r-code-review		
verification-method	before you claim it works	1

REVIEW SUBAGENTS		4, read-only
dependency-auditor	an undeclared symbol	
run-forensics	a failed or odd run	
spatial-correctness-reviewer	CRS and geometry bugs	
pipeline-invalidation-auditor	silently stale targets	

COMPANIONS, BY WORKFLOW STAGE	
plan	brainstorming, writing-plans
implement	r-package-development, quarto-authoring
debug	systematic-debugging
verify	verification-before-completion
review	receiving-code-review
release	package-change-workflow

Which third-party skills to pair with these, and which to avoid, is in docs/third-party.md.

• = paths-scoped: the skill wakes only on matching files. /name = slash command only, never auto-invoked. Plugin counts are skills / hooks / subagents.

HOOKS: R-PROJECT-CORE15 registrations

A GUARD FIRED, DO THIS INSTEAD

SessionStart		1
session-context	host, policy, runs, branch	
PreToolUse / Bash		8
advise-bash-hygiene	a leading cd, a timeout	
guard-credentials	reading or committing keys	
guard-destructive	throws away real work	
guard-host-names	a machine name published	
guard-long-run-interlock	installs during a live run	
guard-policy	installs, air, heavy work	
guard-process-ownership	killing what is not yours	
guard-staging	git add -A, commit -a	
PreToolUse / Edit, Write, Notebook		3
guard-ascii	non-ASCII in R, qmd, bib	
guard-generated-files	editing generated files	
guard-host-names	a machine name published	
PreToolUse / MCP tools		1
guard-mcp	MCP tools that write	
PostToolUse / Edit, Write		2
check-citations	resolves every DOI written	
r-format-and-parse	parses and formats your R	

- ✗ git push --force
 - --force-with-lease
- ✗ git add -A / commit -a
 - stage named paths
- ✗ git reset --hard, clean -f
 - stash, or checkout a named path
- ✗ git branch -D
 - git branch -d
- ✗ install.packages()
 - renv::install("owner/pkg", lock = TRUE)
- ✗ pkill / docker stop
 - check ps, then # owner-verified:
- ✗ heavy job on a controller
 - dispatch it over ssh
- ✗ editing NAMESPACE, man/*.Rd
 - devtools::document()
- ✗ non-ASCII in .R or .qmd
 - the replacement the hook names
- ✗ installing during a live run
 - wait, or stop the run in order

HOOKS: R-PACKAGE-DEV3 registrations

PreToolUse / Edit, Write		1
guard-news-dev-heading	a numbered NEWS heading	
PostToolUse / Edit, Write		1
rbuildignore-claude	.claude into .Rbuildignore	
Stop		1
check-doc-sync	roxygen ahead of man/	

PROJECT POLICY9 keys

.claude/r-project-policy.json: every rule is off until the repo opts in. Generate one with /r-project-core:project-policy.

rBinary	note on a bare Rscript
packageInstall	renv-only installs
noAirFormat	this repo forbids air
publishRequiresApproval	ask before push, gh, MCP
controllerHosts	no heavy compute on these
hostPatterns	ask before naming a host
longRunPatterns	what the interlock sees
heavyCommands	what counts as heavy
asciiExtensions	scope of the ASCII guard

THE SESSION REPORTSessionStart

- the host, and whether it is a controller
- the project policy that loaded, if any
- the rule: fix the root cause, at file:line
- long runs already going, marked as not yours
- running containers and detached screens
- the branch, and changes that predate the session
- submodule pointers that have drifted

WRITING YOUR OWN HOOK

identity	resolve the repo through git, not the working directory
deny	only where a safe alternative exists to take
ask	for what is fine once a person has looked
context	to inform without blocking a risky command

A deny cannot be approved from the permission prompt; an ask can. If a guard fires when it should not, the fix is almost always a policy value rather than a code change.
