

PLUGINS		skills / hooks / subagents
r-project-core	every R research project	6 / 13 / 0
r-package-dev	R package development	3 / 3 / 0
r-targets	{targets} pipelines	5 / 0 / 0
r-geospatial	GIS and spatial analysis	3 / 0 / 0
r-spades	SpaDES modules	2 / 0 / 0
r-landis-ii	LANDIS-II integration	2 / 0 / 0
r-reporting	reports and provenance	3 / 0 / 0
r-code-review	software review	1 / 0 / 4

BUNDLES: ENABLE ONE PER PROJECT		3
r-bundle-research	an R research project project-core, targets, geospatial, reporting, code-review, package-dev	
r-bundle-landis	research, plus LANDIS-II research, landis-ii	
r-bundle-spades	research, plus SpaDES research, spades	

OR ENABLE PLUGINS DIRECTLY	
R package	core, package-dev, code-review
{targets} pipeline	core, targets, code-review
Spatial / GIS	core, geospatial, targets
produces reports	add reporting

INSTALL: ADD BOTH MARKETPLACES

1. add the marketplaces
/plugin marketplace add FOR-CAST/ai_workflows
/plugin marketplace add posit-dev/skills

Nothing auto-adds another marketplace. r-package-dev depends on r-lib@posit-dev-skills, so add both before installing anything; either order works. Skip the posit one and r-package-dev reports r-lib as not installed, while every bundle above it reports the dependency disabled.

2. enable a bundle, then set policy
/plugin install r-bundle-research@ai-workflows
/r-project-core:project-policy

3. share the setup with the project
.claude/settings.json carries extraKnownMarketplaces and enabledPlugins. Declare the posit marketplace there too, though nothing here enables a plugin from it: that is what lets the dependency resolve. The claude plugin CLI does not read project settings, so install from inside a session, once the folder is trusted.

UNINSTALL, OR JUST TURN IT OFF

stop it, remove it, or forget the source
/plugin disable r-package-dev@ai-workflows
/plugin uninstall r-bundle-research@ai-workflows
/plugin prune
/plugin marketplace remove ai-workflows

disable keeps a plugin installed but inert. uninstall removes it, and prune then drops the dependencies it pulled in that nothing else needs, which is worth running after removing a bundle.

or switch off one piece

One hook: drop its entry from that plugin's hooks/hooks.json. All of them: disableAllHooks in settings.
One policy rule: remove its key from r-project-policy.json.

THREE KINDS OF TOOLING	
skills	advice, loaded only when it matches
hooks	rules, run on every turn, failing open
subagents	read-only reviewers, on request

SKILLS: WHEN TO REACH FOR THEM 25

r-project-core	6
citation-integrity•	any DOI or reference
/commit	write the commit
design-log	work spanning sessions
project-config-layout•	a setting missed a worker
/project-policy	a guard fires wrongly
r-style•	writing or editing any R
r-targets	5
hpc-cluster-runs•	launch or stop a long run
targets-debugging	a target failed or hung
targets-project-setup•	structuring targets.R
targets-staleness•	up to date, but is not
targets-testing-ci•	tests and CI for pipelines
r-geospatial	3
raster-scale-and-memory•	raster too big for RAM
spatial-objects-and-targets•	pointers do not serialise
vector-geometry-hygiene•	empty polygons, slivers
r-package-dev	3
package-change-workflow•	a package you maintain
package-conventions•	before air or document()
package-dependencies•	no visible global function
r-reporting	3
provenance-receipts•	where data came from
quarto-reports•	a render landed oddly
report-writing•	prose someone else reads
r-spades	2
module-contract•	wiring a SpaDES module
spades-caching	re-runs it should not
r-landis-ii	2
landis-inputs•	before a LANDIS run
landis-outputs•	reading a LANDIS map
r-code-review	1
verification-method	before you claim it works

REVIEW SUBAGENTS 4, read-only

dependency-auditor	an undeclared symbol
pipeline-invalidation-auditor	silently stale targets
run-forensics	a failed or odd run
spatial-correctness-reviewer	CRS and geometry bugs

COMPANIONS, BY WORKFLOW STAGE

plan	brainstorming, writing-plans
implement	r-package-development, quarto-authoring
debug	systematic-debugging
verify	verification-before-completion
review	receiving-code-review
release	package-change-workflow

Which third-party skills to pair with these, and which to avoid, is in docs/third-party.md.

• = paths-scoped: the skill wakes only on matching files. /name = slash command only, never auto-invoked. Plugin counts are skills / hooks / subagents.

HOOKS: R-PROJECT-CORE14 registrations

A GUARD FIRED, DO THIS INSTEAD

SessionStart		1
session-context	host, policy, runs, branch	
PreToolUse / Bash		7
advise-bash-hygiene	a leading cd, a timeout	
guard-destructive	throws away real work	
guard-host-names	a machine name published	
guard-long-run-interlock	installs during a live run	
guard-policy	installs, air, heavy work	
guard-process-ownership	killing what is not yours	
guard-staging	git add -A, commit -a	
PreToolUse / Edit, Write, Notebook		3
guard-ascii	non-ASCII in R, qmd, bib	
guard-generated-files	editing generated files	
guard-host-names	a machine name published	
PreToolUse / MCP tools		1
guard-mcp	MCP tools that write	
PostToolUse / Edit, Write		2
check-citations	resolves every DOI written	
r-format-and-parse	parses and formats your R	

HOOKS: R-PACKAGE-DEV3 registrations

PreToolUse / Edit, Write		1
guard-news-dev-heading	a numbered NEWS heading	
PostToolUse / Edit, Write		1
rbuildignore-claude	.claude into .Rbuildignore	
Stop		1
check-doc-sync	roxygen ahead of man/	

PROJECT POLICY9 keys

.claude/r-project-policy.json: every rule is off until the repo opts in. Generate one with /r-project-core:project-policy.	
rBinary	note on a bare Rscript
packageInstall	renv-only installs
noAirFormat	this repo forbids air
publishRequiresApproval	ask before push, gh, MCP
controllerHosts	no heavy compute on these
hostPatterns	ask before naming a host
longRunPatterns	what the interlock sees
heavyCommands	what counts as heavy
asciiExtensions	scope of the ASCII guard

- ✗ git push --force
 - --force-with-lease
- ✗ git add -A / commit -a
 - stage named paths
- ✗ git reset --hard, clean -f
 - stash, or checkout a named path
- ✗ git branch -D
 - git branch -d
- ✗ install.packages()
 - renv::install("owner/pkg", lock = TRUE)
- ✗ pkill / docker stop
 - check ps, then # owner-verified:
- ✗ heavy job on a controller
 - dispatch it over ssh
- ✗ editing NAMESPACE, man/*.Rd
 - devtools::document()
- ✗ non-ASCII in .R or .qmd
 - the replacement the hook names
- ✗ installing during a live run
 - wait, or stop the run in order

THE SESSION REPORTSessionStart

- the host, and whether it is a controller
- the project policy that loaded, if any
- long runs already going, marked as not yours
- running containers and detached screens
- the branch, and changes that predate the session
- submodule pointers that have drifted

WRITING YOUR OWN HOOK

identity	resolve the repo through git, not the working directory
deny	only where a safe alternative exists to take
ask	for what is fine once a person has looked
context	to inform without blocking a risky command

A deny cannot be approved from the permission prompt; an ask can. If a guard fires when it should not, the fix is almost always a policy value rather than a code change.
